

# SIM52xx For Android Application Note

<b>Document Title:</b>	SIM52xx For Android Application Note
<b>Version:</b>	0.01
<b>Date:</b>	2010-06-30
<b>Status:</b>	Release
<b>Document ID:</b>	SIM52xx_For_Android_Application_Note_V0.01

**General Notes**

SIMCom offers this information as a service to its customers, to support application and engineering efforts that use the products designed by SIMCom. The information provided is based upon requirements specifically provided to SIMCom by the customers. SIMCom has not undertaken any independent search for additional relevant information, including any information that may be in the customer's possession. Furthermore, system validation of this product designed by SIMCom within a larger electronic system remains the responsibility of the customer or the customer's system integrator. All specifications supplied herein are subject to change.

**Copyright**

This document contains proprietary technical information which is the property of SIMCom Limited., copying of this document and giving it to others and the using or communication of the contents thereof, are forbidden without express authority. Offenders are liable to the payment of damages. All rights reserved in the event of grant of a patent or the registration of a utility model or design. All specification supplied herein are subject to change without notice at any time.

# 1. Introduction

## 1.2 Overview

This document is a brief descriptions on:

- I How to add code modified by SIM52xx for the android source.

## 1.2 References

The present document is based on the following documents:

- [1] SIMCOM\_SIM5218\_ATC\_EN\_V1.11.doc.

## 1.3 Terms and Abbreviations

For the purposes of the present document, the following abbreviations apply:

§ API	Application Programming Interface
§ CPU	Central Processing Unit
§ LIB	Library
§ OS	Operating System
§ PDU	Protocol Data Unit
§ RAM	Random-Access Memory
§ ROM	Read-Only Memory
§ UMTS	Universal Mobile Telecommunications System
§ USIM	Universal Subscriber Identity Module
§ WCDMA	Wideband Code Division Multiple Access

## 2. Modify Linux USB SERIAL Driver

### 2.1 Modify the driver

In fact the kernel with version of 2.6.28 and later has a common driver named usbserial which can be used by our device. We just need to add the device Vendor ID and Product ID to the driver.

There is just one file need to be modified:

drivers\usb\serial\option.c

The flammulated code is our added.

1) drivers\usb\serial\option.c

```
#define SIMCOM_VENDOR_ID          0x05c6
#define SIMCOM_PRODUCT_5218      0x9000
#define SIMCOM_PRODUCT_5210      0x6000

static struct usb_device_id option_ids[] = {
    { USB_DEVICE(OPTION_VENDOR_ID, OPTION_PRODUCT_COLT) },
    { USB_DEVICE(OPTION_VENDOR_ID, OPTION_PRODUCT_RICOLA) },
    { USB_DEVICE(SIMCOM_VENDOR_ID, SIMCOM_PRODUCT_5218) },
    { USB_DEVICE(SIMCOM_VENDOR_ID, SIMCOM_PRODUCT_5210) },
};
```

### 2.2 Build the driver

The following is the steps on how to build the driver after getting the source packet.

1) Use “make menuconfig” and select the following issues as a built-in driver:

Device Drivers -à

USB support -à

USB Serial Converter support -à

USB driver for GSM and CDMA modems

After configuration, these items will be configed:

CONFIG\_USB = m

CONFIG\_USB\_SERIAL=m

CONFIG\_USB\_SERIAL\_GENERIC=y

CONFIG\_USB\_SERIAL\_OPTION=y

2) Use “make zImage” to build the kernel image.

3) If everything goes well, arch/arm/boot/zImage would be generate.

## 3 Build android

### 3.1 Modify the Framework

There are three files need to be modified:

hardware/ril/reference-ril/reference-ril.c

hardware/ril/reference-ril/atchannel.c

external/qemu/telephony/android\_modem.c

1) hardware/ril/reference-ril/reference-ril.c

```
static void onUnsolicited (const char *s, const char *sms_pdu)
{
    char *line = NULL;
    int err;
    .....

    //line 2068

    //else if (strStartsWith(s, "+CMT:")) {
    else if (strStartsWith(s, "+CMT:")) {
        RIL_onUnsolicitedResponse (
            RIL_UNSOL_RESPONSE_NEW_SMS,
            sms_pdu, strlen(sms_pdu));
    }
    .....
}
```

2) hardware/ril/reference-ril/atchannel.c

```
/**
 * returns 1 if line is the first line in (what will be) a two-line
 * SMS unsolicited response
 */
static const char * s_smsUnsoliciteds[] = {
    // "+CMTI:",
    "+CMTI:",
    "+CDS:",
    "+CBM:"
};
```

```
void
amodem_receive_sms( AModem modem, SmsPDU sms )
{
    // #define SMS_UNSOL_HEADER "+CMT: 0\r\n"
    #define SMS_UNSOL_HEADER "+CMT1: 0\r\n"

    if (modem->unsol_func) {
        int len, max;
        char* p;
        strcpy( modem->out_buff, SMS_UNSOL_HEADER );
        p = modem->out_buff + (sizeof(SMS_UNSOL_HEADER)-1);
        max = sizeof(modem->out_buff) - 3 - (sizeof(SMS_UNSOL_HEADER)-1);
        len = smspdu_to_hex( sms, p, max );
        if (len > max) /* too long */
            return;
        p[len] = '\r';
        p[len+1] = '\n';
        p[len+2] = 0;

        R( "SMS>> %s\n", p );

        modem->unsol_func( modem->unsol_opaque, modem->out_buff );
    }
}
```

### 3.2 Build the android image

We are building for i.MX51 BBG3 board, "imx51\_BBG" is the product names (see /work/hummer/android /vendor/fsl/product).

After build, check build\_imx51\_BBG\_android.log to make sure no build error.

```
root@ubuntu:/work/hummer/android#make          PRODUCT-imx51_BBG-eng      2>&1      |      tee
build_imx51_BBG_android.log
```

Or

```
root@ubuntu:/work/hummer/android#   make   PRODUCT-imx51_BBG-eng   -j4   2>&1   |   tee
build_imx51_BBG_android.log
```

Note: 'N' is the number of cores of your CPU such as make -j4 to speed up the compiling time.

After completion, the binaries will be generated under  
/work/hummer/android /out/target/product/ imx51\_BBG /.

Below is the list for reference:

```
root@ubuntu:/work/hummer/android# cd out/target/product/ imx51_BBG /
root@ubuntu:/work/hummer/android/out/target/product/imx51_BBG # ls -al
total 289600
-rw-r--r--  1 root root          7 2010-02-24 22:06 android-info.txt
